What do we do with images?

 The University of Nottingham

- ▶ Resizing
 - Keeping proportions
- ▶ Cropping
- ▶ Mode – black & white or colour
- ▶ Change Image type
 - Web
 - jpeg – Joint Photographic expert group
 - Gif – graphical interchange format
 - Png – latest
 - Optimise
 - Print –
 - TIFF

Image Sources

 The University of Nottingham

Digital Camera On-line
 Scan Screen Capture

On-line Resources

- ▶ Nottingham Image Bank –
<http://www.nottingham.ac.uk/imagebank/login.php>
- ▶ Internet – There is a tool designed by the Open Nottingham project team that only searches for images, video and audio materials licensed so they are suitable for reuse.
 - <http://www.nottingham.ac.uk/xpert/attribution/>

GIMP Orientation

Main Windows

Default Workspace

Note

If your GIMP layout is lost, your arrangement is easy to recover using **Windows** → **Recently Closed Docks** ; the Windows menu command is only available while an image is open. To add, close, or detach a tab from a dock, click  in the upper right corner of a dialog. This opens the Tab menu. Select **Add Tab**, **Close Tab**, or **Detach Tab**.

The Image Window

1. Title Bar
2. Image Menu
3. Menu Button
4. QuickMask Toggle
5. Pointer Coordinates
6. Units Menu
7. Zoom Button
8. Status Area

Opening a new image

- ▶ **File, Open**
- ▶ However – If you have closed the image window:
 - You can drag an image into the Toolbox area to open a window
 - Dragging an image into the image window adds the image into that window.

Zoom and Navigate

- ▶ Open Rodent.jpg

Zoom the
image to
200%-

Drag the
Navigation
Control

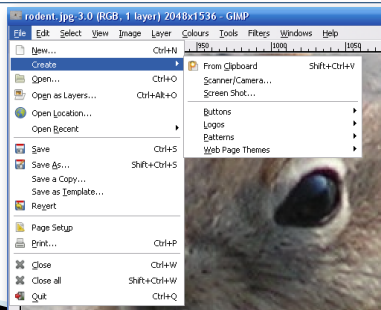

- ▶ Close the file

Working with Tools

- ▶ Point to each tool in order – note keystroke shortcut.
- ▶ Try the paint brush
- ▶ Use undo (Ctrl+z) as often as necessary to remove brush strokes

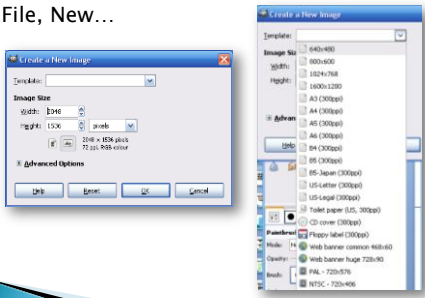

Create

Create a New Image

► File, New...

Printing Sharing and Saving Images

The University of Nottingham

File Formats

The University of Nottingham

- PSD
- XCF
- JPEG
- GIF
- PNG (still not fully supported in all browsers)

Press File, Save As to see File Formats supported by GIMP → press Cancel when finished

Saving an Image

- ▶ You will get different dialog boxes for different image types
- ▶ There are many options on the save dialog box – we do not need to be concerned with all of them if we are only preparing images for the web.
 - If you are interested go to <http://docs.gimp.org/en/gimp-images-out.html#id3147471>

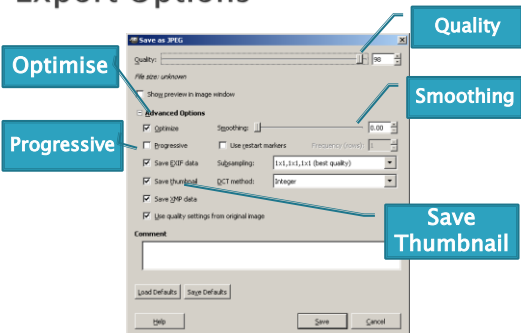

Exporting an Image

- ▶ When you use Save As to save a jpg image you will see the following dialog box

Export Options

Native File Formats

- ▶ A Photoshop/Fireworks/GIMP etc native file format will retain all of the original file's attributes. Saved file characteristics include the following:
 - ▶ Resolution, Color space (CMYK, RGB, grayscale, Spot color channels, Image bit depth
 - ▶ These are 'working' image formats – usually saved as Tiff for printing or other formats for the web.

Colour Modes

- ▶ **Image → Mode**
- ▶ **RGB**
 - **(Red, Green, Blue)** is the standard colour model for images that will be viewed on a **computer**, such as on the web.
 - Every colour on your computer monitor is created by mixing together different amounts of red, green and blue light, where red plus green plus blue light equals white light.
 - RGB is said to be **additive**: *the more light you add to a colour, the brighter the colour gets.*

Undo/Redo

- ▶ Undo the most recent action –
 - **Edit → Undo**
or
Ctrl+Z.
- ▶ Redo
 - **Edit → Redo**
or
Ctrl+Y.

Resize an Image

- ▶ Open hallas_big.jpg
- ▶ **Image → Scale Image**
 - Use pixels for screen
 - Inches/mm for print
- ▶ Always only change width or height (never both)

Image File Size

- ▶ Affected by
 - **Image Dimensions** – actual image size
 - **Image Resolution** – number of pixels per inch (ppi)
 - **Bit Depth** – number of colours
- ▶ **File → Save As**
- ▶ Enter the filename – ie: **rodent_web.jpg**
- ▶ **Reduce the quality of the image**

Resolution Values

Type	Appearance	Measurement	Laser Printer	Newspaper	Magazine
Image Resolution		pixels/inch (ppi)	110–170 ppi	130–200 ppi	200–300 ppi
Halftone Screen		lines/inch (lpi)	71, 85 lpi typical	85, 100 lpi typical	133, 150 lpi typical
Printer Resolution		dots/inch (dpi)	600 dpi typical	1270, 2540 dpi typical	1270, 2540 dpi typical

Understanding File Compression

- ▶ Gimp employs two types of compress schemes — lossy and lossless.
 - **Lossy** compression reduces the size of the file by removing color information — information that can never be restored to the saved document. Files can be reduced by 80 percent or greater.
 - The **lossless** method reduces file size by using compression algorithms that reduce the size of a file without removing image information. Lossy methods are used primarily for images displayed in browsers, or Web images.

Compressing/optimizing

- ▶ Images that contain a lot of solid color information would compress quite well using the GIF (Graphics Interchange) or PNG8 formats.
- ▶ An image with a lot of soft blending colors, such as a photograph, would be best compressed using the JPEG (Joint Photographic Experts Group) format.

There is no going back!

- ▶ Since the lossy compression approach actually removes image data, once an image has been compressed (or over compressed), the damage done is permanent.
- ▶ Always make sure you keep a copy of the image in its original state.

Interpolation

- ▶ Changing the size and/or the resolution of an image forces the image program to add or subtract pixels from the image in a process called interpolation. Interpolation is a mathematical algorithm that changes the image. Adding or subtracting pixel information impacts quality in a negative way. So, plan a project before starting and try to begin with the correct resolution and size.

Resize and optimise images

- Open **Rodent.jpg**
- Note physical size
- Resize to 713 pixels wide
- Save as rodent.jpg into a new folder on desktop called **web ready**
- Reduce the quality to **80%**
- Mark as Progressive
- Compare file size with original
- Repeat process for all the photographs in the **Original Photos** folder

Working with Photographs

- ▶ Perform basic colour correction functions
- ▶ Add text labels to Images.

Copying areas

- › Open the original **Rodent.jpg**
- › Use the select tool to draw a square around the creature
- › Ctrl+C to copy
- › Ctrl+V to Paste
- › Drag the copy

Fixing images

- › Use the **blur** tool to merge the edges where the new area of the picture is.
- › Experiment with the **Options** below the tools
- › Look out for the hints in the status bar below the image.

Clone Stamp Tool

- › Allows you to copy pixels from one part of an image to another part of the same image.
- › Improve the picture by copying parts of the background to cover the join

Repairing Photographs The University of Nottingham

- ▶ The Healing tool allows you to correct and repair imperfections by sampling an image or a pattern and paint copies of it elsewhere, as well as match the texture, lighting, and shading of pixels in an image or pattern to the source pixels.

Healing tool The University of Nottingham

Try the Spot healing tool

- Open **freckles.jpg**
- Zoom in to 400%
- Click on the **Healing** tool
- **Ctrl+click** to select an area next to a freckle
- Click on the freckle
- Zoom out to see the effect
- Carefully replace all the freckles

Flip an Image The University of Nottingham

► Open **mirror-image.jpg**

Use Tools → Transform Tools → Flip,
or use the button on the toolbox

Using the Crop tool The University of Nottingham

Crop tool 
or **Shift + C**

Crop the image
to just show
the notice
board.

**Enter/double
click** to Crop
Esc to cancel
Or **Undo** if
already
pressed **Enter**

Rotate the image The University of Nottingham

Use Image → Transform → Rotate 90°
clockwise

Or Use rotate button for manual
rotation.

You may need to increase the canvas
size – Image, Fit canvas to layers

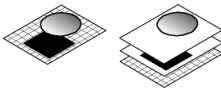

Layer Basics

Using Layers

▶ Each object in a document resides on a layer. You can either create layers before you draw or add layers as needed. The canvas is below all layers and is not itself a layer.

Allows editing without damaging image below

- ▶ Add a layer – Layer, New Layer
- ▶ Select the brush tool and draw on the second layer.
- ▶ Click on the Eye icon next to the new layer to hide it.

Increase Canvas Size

- Image - Canvas Size
- Double the canvas size
- Duplicate the layer
- Click M or Click the Move Tool
- Drag the new image next to the existing
- Flip the second image

Revision

- **Open The_Wrong_Station.jpg**
- Look at the Document information
- Open Flipping and Rotating.xcf
- Copy this image by:-
 - Cropping the image
 - Duplicating a layer
 - Using Horizontal Flip for second image
 - Duplicate another layer - rotate this
- Save image - notice it will not let you save this image as a jpg - save it as xcf.

Create Montage

- A montage is simply more than one image on one canvas
- Open one of the web ready images
- Resize the image to 350 pixels wide
- Image, Canvas Size and change the width to 700 pixels
- Open another web ready image, make this the same size
- Copy and paste as new layer into your canvas
- Use the Move tool to position it
- Add more images as you wish

Flatten Layers

- › When saving images for web and to remove transparency in a .gif file.
- › Image, Flatten Image
- › Notice the background colour
- › Save the image as flatten.jpg
- › Open the original image and change the background colour, save again with a different name.

Text Essentials

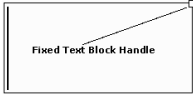

The Text Tool

- › Click once with the text tool
 - As you input text the block expands in one line only.
- › Click and drag
 - As you input text, the text wraps to the next line when it hits the edge of the block

The Text Tool – Fixed Block

Anti-aliasing

Add Text

- ▶ Label any open image
- ▶ Choose the Text Tool
- ▶ Set the options
- ▶ Draw a box on the image and type

Add Text

- ▶ Label any open image
- ▶ Click on Text tool
- ▶ Set font, colour and Size
- ▶ Type text
- ▶ Text box can be moved and resized
- ▶ Practise moving and resizing the text box

Labelling an image

- ▶ Open bigmars.jpg
- ▶ Resize the canvas to add space for the labels
 - 900 height only (break link)

Offset

- ▶ Use the Offset controls to move the image within the canvas

Change background

- Change background colour to black

Extend background layer

- Extend the background layer to fill the new canvas by selecting **Layers > Layer to Image Size**

Add Text

- Click on Text tool
- Set font, colour and Size
- Type text
- Text box can be moved and resized

Text Layers

- ▶ Notice that a text layer has been created.
- ▶ Always ensure this is active before editing text
- ▶ Each new text box has its own layer
- ▶ Continue labelling the image as per the example in your folder.

Digital Photography Resources

- ▶ <http://www.adobe.com/support/forums/main.html> – excellent discussions with advice from users.
